

FACT SHEET

Vuzix – The Company

Vuzix Corporation, formerly Icuiti, is a privately held company and the pioneer in manufacturing Video Eyewear and personal display devices for the mobile video, entertainment, medical and defense markets. The company's ten years of experience in developing advanced proprietary display technology for the military and industrial sectors has laid the foundation for its leadership position in the emerging consumer Video Eyewear market. Vuzix introduced the Video Eyewear product category in 2005 with its award-winning model V920. 2008 marks its third award-winning year at the Consumer Electronics Show for innovation in design and engineering.

Consumer Video Eyewear Line – iWear®

Vuzix' high-resolution Video Eyewear family of consumer products, iWear, solves the main challenge in viewing video and digital information via portable and mobile devices – the small screen. Vuzix' iWear products are worn like regular glasses and provide the effect of a big screen experience, ranging from 44" to 62" virtual screens. iWear is ideal for use with media players, portable DVD players, gaming consoles, cell phones and laptops. The company is focused on making iWear the standard mobile equipment for watching news, sports, music videos and movies, and for playing video games on the go. In the summer of 2007, Vuzix launched the first interactive Video Eyewear, the VR920, which enables users of online games, social virtual worlds and social networking sites to communicate with each other and step 'inside' cyberspace with stereographic 3D. In January 2008, Vuzix will be introducing its AV920-C, which provides an immersive experience and a 62-inch viewing screen for single and multiplayer video games from a single game console.

Displays for Medical and Defense Markets

Vuzix is a leader in delivering products and components for medical and defense applications.

In the medical field, Vuzix', through its Eyetonomy division, is partnering with companies in adapting its technology and delivering products for use in the dental patient distraction, dental surgery, 3D surgery, and low-vision assistance markets. In early February 2008, Eyetonomy will launch its first low-vision assistance Video Eyewear device for patients with age-related macular degeneration and retinitis pigmentosa: the SightMate LV920.

Annually, the company provides tens of thousands of its display systems to the military and partner companies for night vision and other applications. Today, Vuzix is the lead supplier to the U.S. Army's Future Force Warrior program for head-mounted displays and is working under contract with the United States Special Operations Command (USSOCOM) to deliver next generation displays for warfighters.

Headquarters: Rochester, New York
